

## Redaction

Securely remove sensitive information, ensuring data privacy quickly and easily

### Why

Redaction is a crucial process for government agencies that handle sensitive information, ensuring that confidential data is protected before documents are shared or published. Manual redaction can be labour intensive and prone to oversight, leading to potential privacy breaches. Tungsten Automation offers automated redaction solutions that utilise AI to identify and redact sensitive information quickly and accurately, significantly reducing the risk of human error.

The benefits of automated redaction for government agencies are substantial. By streamlining the redaction process, agencies can ensure compliance with privacy laws and regulations while improving the speed of document processing. For those using government services, this means greater assurance that their personal information is handled securely and responsibly. Additionally, automated redaction can enhance transparency in government operations, as agencies can more readily share information with the public while safeguarding sensitive data. This balance between transparency and privacy is essential for maintaining public trust in government institutions.

### How

[JFK Health](#) sought to increase security and reduce costs associated with managing sensitive patient information. By implementing Tungsten Automation, JFK Health established secure print rules and workflows, ensuring confidential documents were not left exposed and unclaimed at printers.

Their solution included the use of automated redaction, blocking sensitive information from being printed when not needed. This approach not only improved security and compliance but also reduced costs and device usage—demonstrating how automation can effectively protect sensitive data while supporting operational efficiency.
